Standardisation of Creative Reference Fields in Playout

1. Purpose

To ensure consistent, accurate, and industry-aligned handling of creative metadata from Playout. This requirement standardises the four creative-related fields populated by media owners and used downstream for reporting by buyers/agencies.

2. Scope

This requirement applies to Dynamic Playout submissions and Media Owner integrations with dynamic content providers.

3. Available Creative Fields

Field Name	Type	Max Length	Description
***creativeid**	Text	64 chars	Media owner–defined creative identifier.
***creativename**	Text	128 chars	Creative title to assist with reporting. Usually a filename.
thirdpartycreativeref	Text	128 chars	**Description of the creative served as defined by a third party (e.g. creative agency).**
creativetriggerevent	Text	64 chars	The creative trigger event, indicating what prompted the given creative to be used.

4. Behaviour for Dynamic Creative

Dynamic content providers should include the following fields in the creative's JSON payload:

- thirdpartycreativeref
- creativetriggerevent

Dynamic content providers should populate these as follows:

- thirdpartycreativeref - description of the creative served as defined by a third party
- creativetriggerevent - the trigger condition used at the point of play

5. Implementation Requirement

Media owners and dynamic content providers should aim to implement the above fields and propagation by 1 April so the industry can start benefiting from the enhanced data as soon as possible.

A transition period may be needed for in-flight campaigns using previous mappings. During this time, systems may require conditional logic to correctly populate the corresponding Playout fields.

6. Acceptance Criteria

1. All creative submissions include the four creative reference fields.
2. Field lengths comply with the specified maximum character limits.
3. Where thirdpartycreativeref and creativetriggerevent are included in the JSON payload, these map to the corresponding fields in Playout.
4. No Playout files are accepted if mandatory fields (creativeid, creativename) are missing or empty.
